

Computer Laboratory - lab sheet 4

Task 1

Copy the program given below. Save (as grade.cpp), compile and run it.

```
// Grade calculator
#include <iostream>
#include <string>
using namespace std;

int main()
{
    int mt1, mt2, fin;
    cout << "Enter the three exam scores: ";
    cin >> mt1 >> mt2 >> fin;

    double avr = 0.3*mt1 + 0.3*mt2 + 0.4*fin;
    cout << "The weighted score is " << avr << endl;

    string grade;
    if (avr < 40. ) grade = "FF";
    else if (avr >= 40. && avr < 50.) grade = "FD";
    else if (avr >= 50. && avr < 60.) grade = "DD";
    else if (avr >= 60. && avr < 70.) grade = "DC";
    else if (avr >= 70. && avr < 75.) grade = "CC";
    else if (avr >= 75. && avr < 80.) grade = "CB";
    else if (avr >= 80. && avr < 85.) grade = "BB";
    else if (avr >= 85. && avr < 90.) grade = "BA";
    else grade = "AA";

    cout << "The grade is " << grade << endl;

    return 0;
}
```

Task 2

Copy the program given below. Save (as calculator.cpp), compile and run it. Rewrite it using else if.

```
// Basic calculator
#include <iostream>
using namespace std;

int main(){
    char op;
    double x, y;

    cout << "Input first number : "; cin >> x;
    cout << "Input an operator : "; cin >> op;
    cout << "Input second number: "; cin >> y;

    switch( op ){
        case '+': cout << "sum = " << x + y << endl; break;
        case '-': cout << "difference = " << x - y << endl; break;
        case '*': cout << "multiplication = " << x * y << endl; break;
        case '/': cout << "ratio = " << x / y << endl; break;
        default : cout << "undefined operator: " << op << endl;
    }
    return 0;
}
```

Task 3

A composite function is shown in Figure. Write a program to input a value x and output the evaluated function $y = f(x)$. Verify that your programs work correctly by testing it with appropriate inputs.
