

EP486 Microcontroller Applications

Topic 1

Review of C/C++

Department of
Engineering Physics

University of Gaziantep

Sep 2013

Data Types

C++ provides 6 fundamental data types:

char

int

float

double

bool

wchar_t

```
int i, j = 0;  
long k;  
float w, x, y, z = 0.7;  
double speed, dragForce;
```

In C++, a variable can have either *local* or *global* scope.

```
#include <iostream>
using namespace std;
```

```
int pos1, pos2;
unsigned long salary;
double x, y;
```

```
int main()
{
```

```
    long i, n;
    float max = 20.0;
    bool isPrime;
```

```
    cout << "input an integer: ";
    cin >> n;
    .
    .
    .
```

```
    return 0;
}
```

*main body of
the source code*

global variables

local variables

instructions

- Floating point literals express numbers with decimals and/or exponents. The symbol **E** or **e** is used in the exponent.

```
x = 123.456;      // decimal real number  
x = 1234.56e-1; // exponent (means 1234.56x10-1)  
e = 1.6E-19;     // exponent (means 1.6x10-19)  
A = 6.02e23;     // exponent (means 6.02x1023)
```

Basic Intrinsic Functions

An *intrinsic* or a *library* function is a function provided by C++ language. For example the **cmath** library contains mathematical functions/constants:

Some C++ library mathematical functions and constants defined in `<cmath>`

Function Declaration	Description	Example	Result
<code>double fabs(double x);</code>	absolute value of real number, $ x $	<code>fabs (-4.0)</code>	4.0
<code>int floor(double x);</code>	round down to an integer	<code>floor (-2.7)</code>	-3
<code>int ceil(double x);</code>	round up to an integer	<code>ceil (-2.7)</code>	-2
<code>double sqrt(double x);</code>	square root of x	<code>sqrt (4.0)</code>	2.0
<code>double pow(double x, double y);</code>	the value of x^y	<code>pow (2., 3.)</code>	8.0
<code>double exp(double x);</code>	the value of e^x	<code>exp (2.0)</code>	7.38906
<code>double log(double x);</code>	natural logarithm, $\log_e x = \ln x$	<code>log (4.0)</code>	1.386294
<code>double log10(double x);</code>	base 10 logarithm, $\log_{10} x = \log x$	<code>log10 (4.0)</code>	0.602060
<code>double sin(double x);</code>	sinus of x (x is in radian)	<code>sin (3.14)</code>	0.001593
<code>double cos(double x);</code>	cosine of x (x is in radian)	<code>cos (3.14)</code>	-0.999999
<code>double tan(double x);</code>	tangent of x (x is in radian)	<code>tan (3.14)</code>	-0.001593
<code>double asin(double x);</code>	arc-sine of x in the range $[-\pi/2, \pi/2]$	<code>asin (0.5)</code>	0.523599
<code>double acos(double x);</code>	arc-cosine of x in the range $[-\pi/2, \pi/2]$	<code>acos (0.5)</code>	1.047198
<code>double atan(double x);</code>	arc-tangent of x in the range $[-\pi/2, \pi/2]$	<code>atan (0.5)</code>	0.463648
<code>M_PI</code>	constant pi	<code>myPI = M_PI</code>	3.141592...
<code>M_E</code>	constant e	<code>x = M_E</code>	2.718281...

Operators

Operator	Description	Example	Result
+	Addition	13 + 5	18
-	Subtraction	13 - 5	8
*	Multiplication	13 * 5	65
/	Division	13 / 5	2
%	Modulus (remainder from x/y)	13 % 5	3

Operator	Description	Example	Equivalent to
<code>+=</code>	add and assign	<code>x += 3</code>	<code>x = x + 3</code>
<code>-=</code>	subtract and assign	<code>x -= 5</code>	<code>x = x - 5</code>
<code>*=</code>	multiply and assign	<code>x *= 4</code>	<code>x = x * 4</code>
<code>/=</code>	divide and assign	<code>x /= 2</code>	<code>x = x / 2</code>
<code>%=</code>	find remainder and assign	<code>x %= 9</code>	<code>x = x % 9</code>

printf() Function

```
#include <stdio>
```

Example

```
printf("Hello World\n");
```

```
int x = 112;  
printf("x = %d\n");
```

```
float y = 45.3;  
printf("y = %f\n");
```

Output

```
Hello World
```

```
x = 112
```

```
y = 45.30000
```

Type Specifiers

Tablo 4.2: Tip karakterleri

Tip Karakteri	Anlamı	Yazdırılacak veri tipi
%c	tek bir karakter	char
%s	karakter dizisi (string)	char
%d	işaretli ondalık tamsayı	int, short
%ld	uzun işaretli ondalık tamsayı	long
%u	işaretsiz ondalık tamsayı	unsigned int, unsigned short
%lu	işaretsiz uzun tamsayı	unsigned long
%f	Gerçel sayı	float
%lf	Çift duyarlı gerçel sayı	double

Relational Operators

Operator	Description	Example
<	less than	x < y
<=	less than or equal to	x <= y
>	greater than	x > y
>=	greater than or equal to	x >= y
==	equal to	x == y
!=	not equal to	x != y

Logical Operators

Operator	Description	Example
&&	logical AND, conjunction. Both sides must be true for the result to be true	x > 2 && y == 3
	Logical OR, disjunction. The result is true if either side or both sides are true.	x > 2 x <= 9
!	Logical NOT, negation	!(x>0)

if ... else structure

```
// Quadratic roots
#include <iostream>
#include <cmath>
using namespace std;

int main() {
    double a, b, c;
    cin >> a >> b >> c;

    double Delta = b*b - 4*a*c;

    if ( Delta < 0. ) {
        cout << "The roots are imaginary!" << endl;

    } else if ( Delta == 0. ) {
        double x1 = -b / (2*a);
        cout << "The root is " << x1 << endl;

    } else {
        double x1 = ( -b - sqrt(Delta) ) / (2*a);
        double x2 = ( -b + sqrt(Delta) ) / (2*a);
        cout << "The two roots are "<< x1<< " and " << x2<< endl;
    }
}
```

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Loops

Calculate the series sum: $1 + 1/2 + 1/3 + 1/4 + 1/5 + \dots + 1/n$.

```
int main() {  
  
    cout << "Input n: ";  
    int n;  
    cin >> n;  
  
    float k=1, s=0;  
  
    while (k<=n) {  
        s = s + 1.0/k;  
        k++;  
    }  
  
    cout << s << endl;  
}
```

```
int main() {  
  
    cout << "Input n: ";  
    int n;  
    cin >> n;  
  
    float k=1, s=0;  
  
    do{  
        s = s + 1.0/k;  
        k++;  
    }while(k<=n);  
  
    cout << s << endl;  
}
```

Calculate the series sum: $1 + 1/2 + 1/3 + 1/4 + 1/5 + \dots + 1/n$.

```
int main() {  
  
    cout << "Input n: ";  
    int n;  
    cin >> n;  
  
    float k=1, s=0;  
  
    for(k=1; k<=n; k++) {  
        s = s + 1.0/k;  
    }  
  
    cout << s << endl;  
}
```

Jump Statements: break and continue

```
// break statement
```

```
int main()
{
    double x;

    for(int i = -3; i<=3; i++)
    {
        if(i==0) break;
        x = 1.0/i;
        cout << x << endl;
    }
}
```

```
-0.3333
-0.5
-1
```

```
// continue statement
```

```
int main()
{
    double x;

    for(int i = -3; i<=3; i++)
    {
        if(i==0) continue;
        x = 1.0/i;
        cout << x << endl;
    }
}
```

```
-0.3333
-0.5
-1
1
0.5
0.3333
```

Arrays

```
int main()
{
    const int n = 5;
    float a[] = {8.4, 3.6, 9.1, 4.7, 3.9};
    int b[n] = {4, 2};
    double c[n] = {0.0};

    for (int i = 0; i<n; i++)
        cout << a[i] << b[i] << c[i] << endl;
}
```

Functions

```
// the Function
double factorial(int n)
{
    double f = 1.0;
    for(int i=1; i<=n; i++) {
        f *= i;
    }
    return f;
}

int main() {
    cout << factorial(10) << endl;
}
```

```
#include <iostream>
Using namespace std;

int x;

void setup() {
    x = 3;
}

void printDouble()
{
    cout << 2*x << endl;
}

int main() {
    setup();
    printDouble();
}
```

```

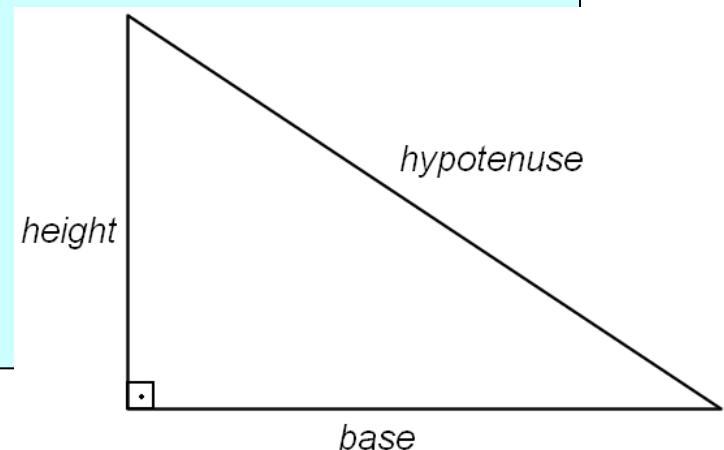

// Function 1
double area(double base, double height) {
    return base * height / 2.0;
}

// Function 2
double hypo(double base, double height) {
    return sqrt(base*base + height*height);
}

int main() {
    double b = 3.0 ,h = 4.0;

    cout << area(b, h) << endl;
    cout << hypo(b, h) << endl;
}

```

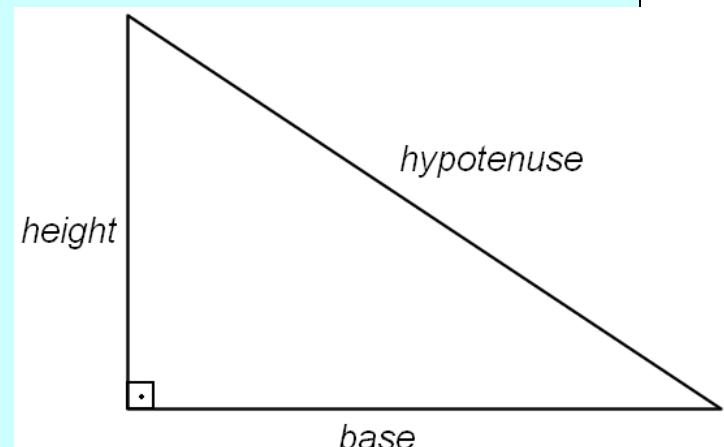

Classes - 1

```
class Triangle{
public:
    double base, height;
    Triangle(double B, double H) {
        base = B; height=H;
    }
    double area(){
        return base * height / 2.0;
    }
    double hypo(){
        return sqrt(base*base + height*height);
    }
};

int main(){
    Triangle T(3,4);

    cout << T.area() << endl;
    cout << T.hypo() << endl;
    cout << T.base << endl;
}
```

Classes - 2

```
class Triangle{  
public:  
    double base, height;  
    Triangle(double B, double H) {  
        base = B; height=H;  
    }  
    double area(){  
        return base * height / 2.0;  
    }  
    double hypo(){  
        return sqrt(base*base + height*height);  
    }  
};  
  
int main(){  
    Triangle* T = new Triangle(3,4);  
  
    cout << T->area() << endl;  
    cout << T->hypo() << endl;  
    cout << T->base << endl;  
}
```
